Abstract

The Hospital Management System is a web-based platform designed to simplify the management of hospital services and patient information. The main objective of this project is to create a centralized system where patients can view doctors, book appointments, and access basic hospital services online, while administrators can manage doctor details and appointments efficiently.

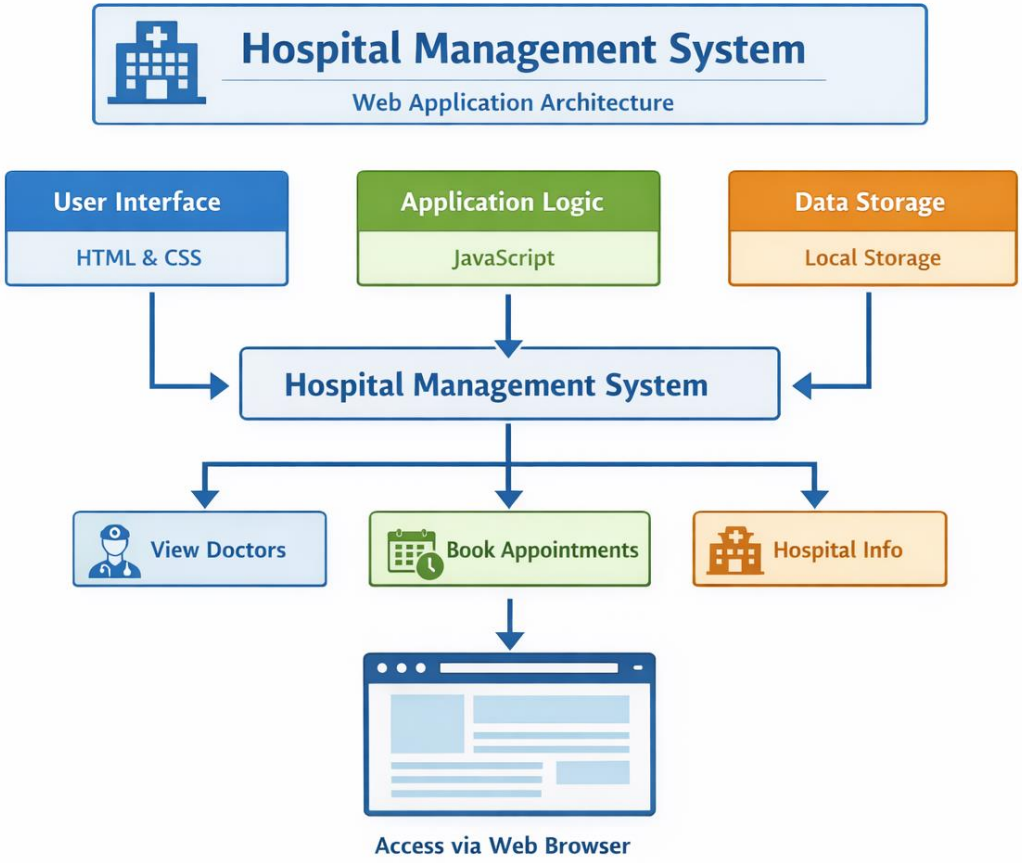
The website includes features such as doctor listings, appointment scheduling, and a dashboard interface to organize hospital activities. It is developed using HTML, CSS, and JavaScript to provide a simple, responsive, and interactive user interface. This system helps improve hospital management, reduce manual work, and provide easier access to healthcare services for patients.

Existing System

In the existing system, most hospitals manage patient records, appointments, and doctor information manually or through basic communication methods such as phone calls and paper records. Although these methods allow hospitals to provide services, they are not well organized and it becomes difficult to manage patient information efficiently.

Appointment scheduling is often done manually, which can lead to delays, confusion, and longer waiting times for patients. In addition, patient records and doctor details may not be easily accessible when needed. Because of these limitations, managing hospital operations becomes time-consuming and less efficient. Therefore, a dedicated digital platform is needed to organize hospital services and manage patient and doctor information effectively.

System Architecture



Project Modules

- User Registration & Login:
  Allows users to create accounts and log in to the system.

- Doctor Management:
  Displays the list of doctors and their specializations.

- Appointment Booking:
  Enables patients to book appointments with doctors.

- Patient Information:
  Stores basic patient and appointment details.

- Dashboard:
  Shows hospital services, doctors, and appointments in one place.

Objectives

- To create a platform where patients can easily view doctors and hospital services.
- To provide a centralized system for managing hospital information.
- To allow patients to book appointments with doctors online.
- To help hospitals organize patient and doctor details efficiently.
- To provide a simple and user-friendly interface for users.

Co’s Attainments - FWD

CO1 – Apply Internet Fundamentals, HTML & Introductory CSS Styling

The project uses HTML to design the structure of the hospital website (forms, doctor cards, dashboard) and CSS for styling and layout, showing basic web development concepts.

CO2 – Apply HTML Forms, Semantic Tags & Comprehensive CSS Layouts

The system includes login, signup, and appointment booking forms, uses semantic HTML elements, and implements responsive layouts using CSS.

CO3 – Apply JavaScript Programming Essentials

JavaScript is used to handle user input, manage doctor and appointment data, and store information using localStorage.

CO4 – Apply JavaScript Interactivity & DOM

The project uses DOM manipulation and event handling to dynamically display doctors, appointments, and user interactions.

CO5 – Apply Advanced Web Development & Deployment

The project integrates features like appointment booking, doctor listings, dashboard interface, and interactive UI, demonstrating advanced front-end web development.

Co’s Attainments - DSA

CO1: Implemented searching and sorting algorithms to manage doctor and appointment data efficiently.

CO2: Used Linked List to store and manage patient or appointment records.

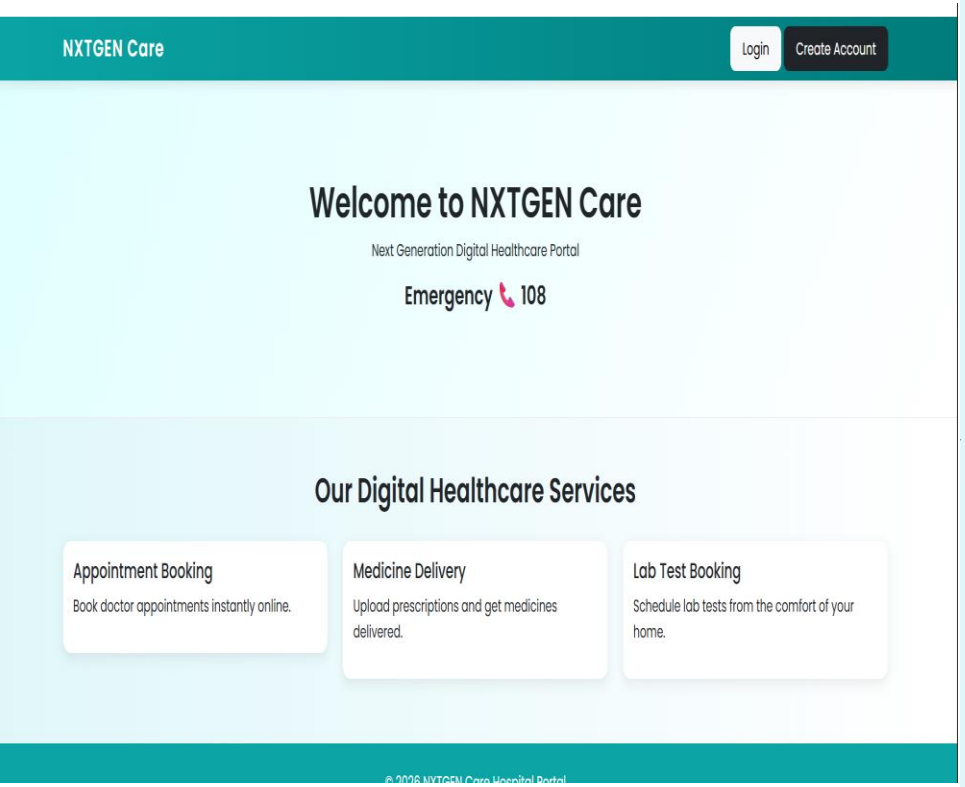
CO3: Applied Stack and Queue to manage recent activities and appointment requests.

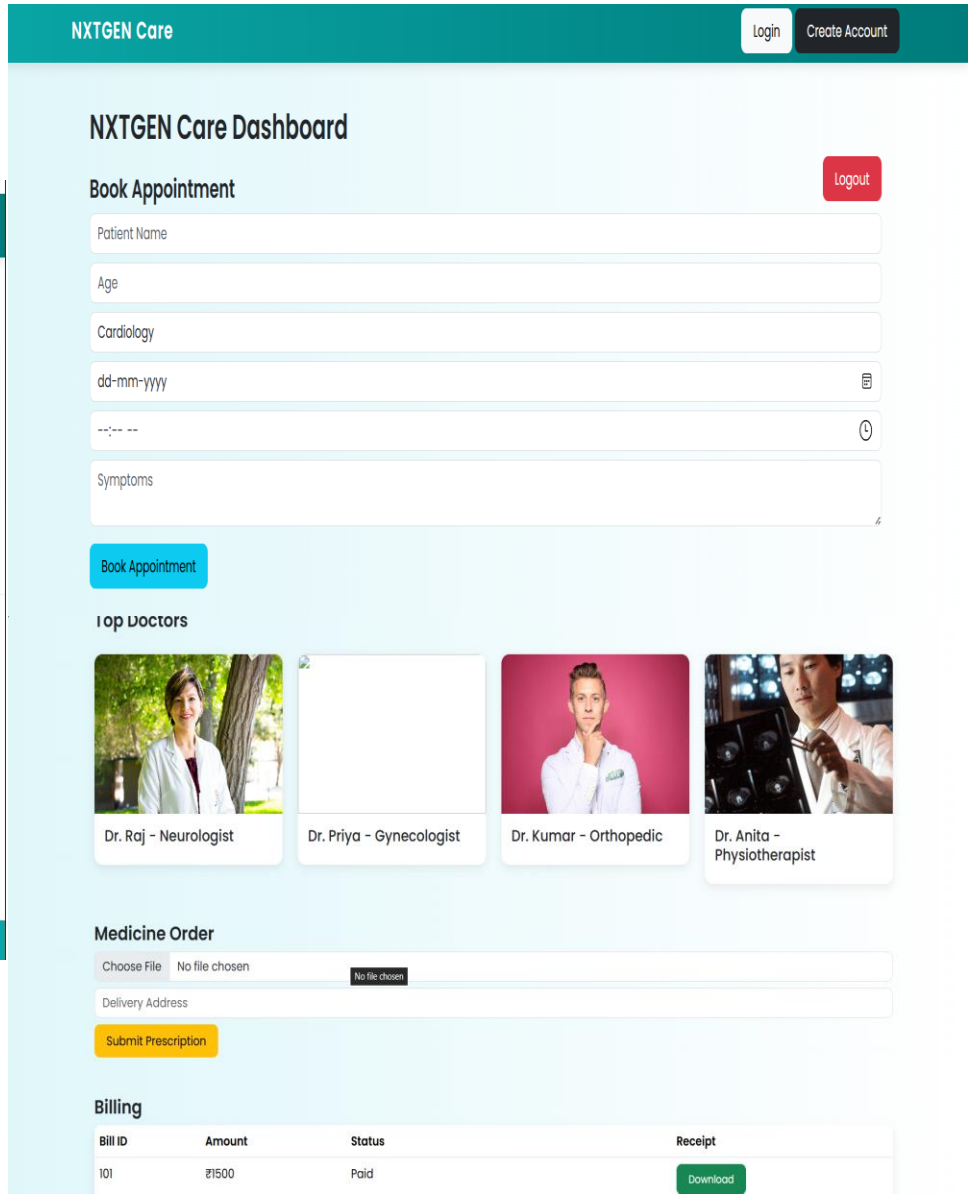
CO4: Used HashMap (hashing) for quick access to patient or doctor details using IDs.

CO5: Developed a practical application using linear data structures for hospital data management.

CO6: Built a menu-driven Java program integrating multiple data structures and algorithms.

Screenshots for fwd





Conclusion

The Hospital Management System demonstrates the practical implementation of a web-based application using HTML, CSS, and JavaScript. The system allows users to view doctors, book appointments, and access hospital information through a simple and interactive interface. It helps organize patient and doctor details efficiently and reduces manual work in managing hospital services. Overall, the project shows how basic web technologies can be used to develop a simple and effective hospital management system that improves accessibility and management of healthcare services.
